NOTE: This is a 'working draft' sequence. It currently consists of 27 contigs. The true order of the pleces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

It currently consists of 33 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                             contig of 1187 bp in length gap of unknown length contig of 2088 bp in length gap of unknown length length contig of 2083 bp in length contig of 1171 bp in length gap of unknown length gap of unknown length gap of unknown length contig of 1885 bp in length contig of 1385 bp in length contig of 1773 bp in length gap of unknown length contig of 1773 bp in length contig of 1773 bp in length gap of unknown length contig of 1885 bp in length contig of 1885 bp in length gap of unknown length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      bp in length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    length

University School of Medicine, 4444 Forest Park Parkway, St. Louis,
MM 0 63108, USA
On Oct 4, 2000 this sequence version replaced 91:10312295.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   * NOTE: This is a 'working draft' sequence. It currently consists of 25 contigs. The true order of the pleces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as * runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

NOTE: This is a 'working draft' sequence. It currently consists of 30 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Exiguus, Saccharomyces servazzii, Zygosaccharomyces rouxii, Saccharomyces kluyveri, Kluyveromyces thermotolerans, Kluyveromyces lactis var. lactis, Kluyveromyces thermotolerans, Kluyveromyces angusta, Debaryomyces hansenii var. hansenii, Pichia sorbitophila. Candida tropicalis and Yarrowia lipolytica. Genomic inserts of 3 to 5 kb were prepared and both extremities were sequenced. See theywords for description of this sequence and for the sequence of the other extremity of this insert.
                                                                                                                                                                                                                                                                                                                                          Direct Submission
Submitted (08-SEP-2000) Genoscope - Centre National de Sequencage,

This STS is part of a random genomic sequencing program of thirteen yeast species: Saccharomyces bayanus var. uvarum, Saccharomyces servazii, Zygosaccharomyces rouxii, Saccharomyces kluyveri, Kluyveromyces thermotolearans, Kluyveromyces lactis var. lactis, Kluyveromyces marxianus var. marxianus, Pichia angusta, Debaryomyces hansenii var. hansenii, Pichia sorbitophila, Candida tropicalis and Yarrowia lipolytica. Genomic inserts of 3 to 5 kb were prepared and both extremities were sequenced. See keywords for description of this sequence and for the sequence of the other extremity of this insert.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                similarity to ribosomal protein L24.e.B ]

This STS is part of a random genomic sequencing program of thirteen yeast species: Saccharomyces bayanus var. uvarum, Saccharomyces cavazzii, Zygosaccharomyces rouxii, Saccharomyces Ruuyveringves payanus var. marxianus, Kluyveromyces lactis var. lactis, Kluyveromyces marxianus var. marxianus, Pichia angusta, Debaryomyces hansenii var. hansenii, Pichia sorbitophila, Candida tropicalis and Yarrowia lipolyfica. Genomic inserts of 3 to 5 kb were prepared and both extremities were sequenced. See keywords for description of this sequence and for the sequence of the other extremity of this insert.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

This STG is part of a random genomic sequencing program of thirteen yeast species: Saccharomyces bayanus var. uvarum, Saccharomyces exiguus, Saccharomyces servazzi, Zygosaccharomyces rouxil.
Saccharomyces kluyveri, Kluyveromyces thermotolerans, Kluyveromyces lactis var. lactis, Kluyveromyces marxianus var. marxianus, Pichia angusta, Debaryomyces hansenii var. hansenii, Pichia sorbitophila, Candida tropicalis and Yarrowia lipolytica. Genomic inserts of 3 to keywords for description of this sequence and for the sequence of the other extremity of this insert.

This STS is part of a random genomic sequencing program of thirteen
yeast species: Saccharomyces bayanus var. uvarum. Saccharomyces
exiguus, Saccharomyces bayanus var. uvarum. Saccharomyces
lactis var. lactis, Kluyveromyces thermotolerans, Kluyveromyces
lactis var. lactis, Kluyveromyces marxianus var. marxianus, Pichia
angusta, Debaryomyces hansenii var. marxianus, Pichia
angusta, Debaryomyces hansenii var. hansenii, Pichia sorbitophila,
Candida tropicalis and Yarromia lipolytica. Genomic inserts of 3 to
5 kb were prepared and both extremities were sequenced. See
keywords for description of this sequence and for the sequence of
the other extremity of this insert.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             2. The invention relates to peptides enterocin 900, brochocin-C that inhibit bacterial growth. Microorganisms expressing the above peptides are used to inhibit bacterial growth. In foods (specifically meat), live animals (applied topically), food preparation areas and fermentation vessels. The bacterocins enterocin 900, brochocin-C may be used directly, specifically continuity bacteria that cause mastitis. Antibodies specific for the peptides are used to detect expression of bacterocins in cells. Secretory vectors (containing sequences for a promoter, a leucocin A processing peptide, a heterologous peptide, lcaC and lcaD) are used to secrete cand as problotics. L. gelidum, or other leucocin A-expressing bacteria, inhibit the growth of Listeria and the sulphide-producing spoilage inhibit the growth of Listeria and the sulphide-producing spoilage or organism Lactobacillus sake, they also improve the sensory properties (smell), taste and colour) of meat, specifically ground beef. L. gelidum can also be used in preparation of animal feeds (silage), as probiotic, to control salmonella in poultry intestines and therapeutically against mucosal tissue infections. Treatment with bacterocins provides vacuum-content products with predictable and longer storage life. The secretion vectors can express several bacteriocins for broader spectrum of activity, e.g. tailored for a particular target organism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           treatment; EST; expressed sequence tag; cytostatic;

                                                                                                                                                                                                                                                                                                           This DNA sequence comprises the enterocin-900 operon of Enterococcus faectum 900, including an open reading frame for enterocin-900 (see AAM$9024). Enterocin-900 is a novel broad spectrum bacteriocin that has activity against other strains of Enterococcus as well as many other organisms. The invention includes a method for inhibiting pathogenic bacterial by providing a bacteriocin selected from enterocin-900 and brochocin-C (see AAW$9021), either as a composition or by providing a bacterial source of the bacteriocins. This is used to inhibit spoilage bacterial in foodstuffs, such as meat, inhibit pathogenic bacterial topically in animals, e.g. to treat mastitis (claimed), and inhibit bacterial infection of fermentation reactors.
                                                                                                                                                                 Bacterial growth inhibiting peptide(s) enterocin 900 or brochocin C - used to inhibit growth of susceptible bacteria in e.g. foodstuff, living animal, food preparation area or fermentation vessel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ő

This invention describes novel polypeptide fragment sequences (I) and their encoding nucleic acids (II) which are highly expressed in normal bladder tissue and have cytostatic activity. (II) are used for recombinant expression of (I) and to isolate complete genes. (I) are used to identify agents suitable for the treatment of bladder tumours, to directly treat this form of cancer (including expression from gene therapy vectors), or are used in a preparation for cancer treatment. (I) is also used for the generation of specific antibodies. (II) are identified by assembling ESTS (expressed sequence tags) from a particular tissue type before comparison of expression patterns. This allows a significantly longer fragment of the gene to be revealed, and therefore reduces the number of failures because of ESTS from different inbraries representing different parts of the same unknown gene distorting the estimated frequency of occurrence in a particular tissue. AAZ4112-24224 represent EST fragments derived from a human normal bladder tissue cDNA library which encode the protein fragments
                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes novel polypeptide fragment sequences (I) and their encoding nucleic acids (II) which are highly expressed in normal bladder tissue and have cytostatic activity. (II) are used for recombinant expression of (I) and to isolate complete genes. (I) are used to identify agents suitable for the treatment of bladder tumours, to directly treat this form of cancer (including expression from gene therapy vectors), or are used in a preparation for cancer treatment. (I) is also used for the generation of specific antibodies. (II) are identified by assembling ESTs (expressed sequence tags) from a particular tissue type before comparison of expression patterns. This allows a significantly longer fragment of the gene to be revealed, and therefore reduces the number of failures because of ESTs from different libraries representing different parts of the same unknown gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      distorting the estimated frequency of occurrence in a particular tissue.
AAX42122-Z42248 represent EST fragments derived from a human normal
bladder tissue cDNA library which encode the protein fragments

This sequence represents cDNA encoding mouse Tespec PRO-2 (testis specific serine protease-2). The invention relates to novel murine and human testis specific serine proteases (AAB03156-B03160) and to cDNAs encoding them (AAA6158-A61562). It also encompasses expression vectors and host cells comprising a nucleotide sequence encoding a protease of the invention, inhibitors of the proteases and antibodies against the proteases. The novel proteases are members of the trypsin family the serine and histidine active site signatures characteristic of this family. The proteases are specifically expressed in mature testis and participate in the differentiation and maturation of sperm. The proteases are potentially useful for the development of pharmaceuticals for the treatment of male infertility and other male reproductive disorders, and for the development of contraceptives. They may also be used as reagents for the diagnosis of male infertility.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    pain family serine proteases expressed specifically in mature testis development of methods for diagnosis and treatment of sterility and

Nucleic acids encoding 26 human secreted polypeptides, useful e.g. for preventing, diagnosing and/or treating cancers and for promoting wound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to 26 secreted human proteins. The proteins may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate polypeptide expression. For example, they may be used in gene therapy or in vaccines. Typical of diseases which are potentially treatable are cancers (including leukemia), autoimmune diseases, allergies, inflammation, graft rejection, hyperproliferation, cardiovascular diseases (particularly critical limb ischemia and coronary disease) and any involving abnormal anglogenesis, neurodegeneration and/or
                                                                                                                                                                                                                                                                                                Shi Y;

The proteins may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate polypeptide expression. For example, they may be used in gene therapy or in vaccines. Typical of diseases which are potentially treatable are cancers (including leukemia), autoimmune diseases, allergies, inflammation, graft rejection, hyperpoliferation, cardiovascular diseases (particularly critical limb ischemia and coronary disease) and any

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; seripancrin; serine protease; chromosome 11q22-q23; therapy; arthritis; chronic obstructive pulmonary disorder; COPD; cancer; osteoporosis; aberrant wound healing; angiogenesis; diabetes; inflammatory disorder; stroke; cartoke; artoke; andiovascular disease; gene therapy; vaccine; cytostatic; cerebroprotective; vulnerary; osteopathic; ss.
                                                                                                                                                                                                                                                                                                                                                                                                 proteins may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate polypeptide expression. For example, they may be used in gene therapy or in vaccines. Typical of diseases which are potentially treatable are cancers (including leukemia), autoimmune diseases, allergies, inflammation, graft rejection, hyperproliferation, cardiovascular diseases involving abnormal anglogenesis, neurodegeneration and/or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to seripancrin polynuclectides, and polypeptides encoded by them. Seripancrin are members of serine protease family. This protein contains a transmembrane domain, a low density lipoprotein (LDL) domain, protease domain and a low density lipoprotein (LDL) domain, protease domain and a cavenger receptor cysteine-rich (SRCR) domain. The LDL and SRCR domains help to define the specificity of seripancrin's intra and intermolecular interactions. The polynuclectides and polypeptides of the invention are useful for treating and diagnosing diseases such as arthritis, chronic obstructive pulmonary disorder (CDPD), cancer, osteoporosis, aberrant wound healing, angiogenesis, inflammatory disorders, diabetes, stroke and cardiovascular diseases. Seripancrin genes are useful in chromosome localisation studies, as tools for tissue expression studies and also in gene therapy.

The polypeptides of the invention are used for identifying agonists and antagonists useful for treating conditions associated with and antagonists useful for treating conditions associated with seripancrin imbalance. These polypeptides are also useful as vaccines.

The prosent sequence is a CDNA coding for seripancrin protein. The seripancrin gene is located on human chromosome 11q22-q23.
                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                   New extracellular serine protease Seripancrin, useful for treating cancer, osteoporosis, arthritis, chronic obstructive pulmonary disease, disbetes, inflammatory disorders, stroke, anglogenesis and aberrant wound healing

The present sequence is a cDNA encoding hRUP5, an endogenous human orphan G protein-coupled receptor (GPCR). The full length hRUP5 cDNA was cloned by RT-PCR using human peripheral leucocyte cDNA as template. The orphan GPCR of the invention, like all GPCRs has seven transmembrane alpha helices with an extracellular N-terminus and an intracellular C-terminus. However, no endogenous ligands has yet been identified for the proteins of the invention. The orphan GPCRs may be used in the condition of their endogenous ligands, and to screen potential GPCR agonists and antagonists for use as pharmaceutical agents. The proteins may also be used in the study of GPCR-mediated signalling cascades, and to elucidate their precise role in normal and diseased human conditions. Nucleic acid encoding human orphan GPCRs may be used for tissue localisation expression analysis to provide information about their function in healthy and pathological states.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel human orphan G protein-coupled receptors and the encoding cDNAs for use in the identification of G protein-coupled receptor agonists
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human G protein coupled receptor hRUP5 encoding cDNA SEQ ID NO:9.

The present sequence is the human G-protein coupled receptor, AXOR14, gene as derived from an Expressed Sequence Tag (EST). G-protein coupled receptors are also known as 7-transmembrane (7TM) receptors. The present sequence is located on chromosome 11q13.The AXOR14 protein functions in hormone signal transduction. AXOR14 protein may be used in the chromosome infaction. AXOR14 protein may be used in the identification of agonists, antagonists or inhibitors that can be used in therapy of microbial infections (e.g. HIV-1 and HIV-2), pain, cancers, psychotic and neurological disorders, allergies, diabetes, obesity, anorexia, bulimia, Parkinson's disease, acute heart failure, hypotension, hypertension, urinary retention, osteoporosis, angina percenting, dyskinesias or Huntingfon's disease which may be caused by inappropriate AXOR14 activity or imbalance. The actual gene may also be used in gene therapy for the above disorders.
                                                                                                     Human, G-protein coupled receptor; AXOR14; signal transduction; 7TM receptor; gene therapy; infection; cancer; autoimmunity; Parkinson's disease; cardiovascular disorder; neurological disorder; Huntington's disease; diabetes; obesity; dyskinesias; chromosome 11q13; anorexia; bulinia; osteoporosis; 7 transmembrane receptor; EST; expressed sequence tag; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         human G protein coupled receptors (GPCR), for which the endogenous ligand is unknown (orphan GPCR receptors). More specifically the present invention relates to non-endogenous, constitutively activated versions of a human GPCR. These non-endogenous human GPCRs can be useful for the direct identification of candidate compounds as receptors agonists, inverse agonists or partial agonists for use as pharmaceutical agents. The present invention relates to seripancrin polynucleotides, and polypeptides encoded by them. Seripancrin are members of serine polypeptides encoded by them. Seripancrin are members of serine coptoness family. This protein contains a transmembrane domain, a low density lipoprotein (LDL) domain, protease domain and a scavenger receptor cysteine-rich (SRCR) domain. The LDL and SRCR domains help to define the specificity of seripancrin's intra and intermolecular interactions. The polynucleotides and polypeptides of the invention are useful for treating and diagnosing diseases. C such as arthritis, chronic obstructive pulmonary disorder (COPD), cancer, osteoporosis, aberrant wound healing, anglogenessis, inflammatory disorders, diabetes, stroke and cardiovascular diseases. Seripancrin genes are useful in chromosome localisation studies, as tools for tissue expression studies and also in gene therapy. The polypeptides of the invention are used for identifying agonists and antagonists useful for treating conditions associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cancer, osteoporosis, arthritis, chronic obstructive pulmonary disease, diabetes, inflammatory disorders, stroke, anglogenesis and aberrant

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence encodes the marigold beta-cyclase. The invention relates to transgenic plant material containing an isolated DNA encoding a marigold enzyme having catalytic activity of beta-cyclase, beta-hydroxylase, epsilon-cyclase, or isopentyl pyrophosphate (IPP) isomerase. The DNA sequences can be used in a method for manipulating carotenoid synthesis in a plant material. The method is used to produce transgenic marigold plants which have enhanced production of specific carotenoid products, e.g. beta-carotene, alpha-carotene, caexanthin, lycopene, zeinoxanthin, beta-cryptoxanthin, rubixanthin, and combinations thereof. The method can also be used to increase or decrease expression of beta-cyclase, can also be used to increase or decrease expression of beta-cyclase,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 beta-hydroxylase, epsilon cyclase, or IPP isomerase enzymes in transgenic marigolds. The invention allows enhanced production of specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel method for regulating carotenoid biosynthesis in Marigolds by modulating the catalytic activity of beta- cyclase, beta-hydroxylase, epsilon cyclase, or IPP isomerase

                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This nucleotide sequence codes for HUPW-6 (see AAY06437), a novel human protease. HUPM-6 CDNA was initially identified in Incyte clone 1337018 from the colon CDNA library COLNNOT13 using a computer search for anino acid sequence alignments. The present sequence is a consensus sequence derived from overlapping and/or extended nucleic acid sequences: Incyte Clones 127172 (TESTTUTO2), 1337018, 586582 and 588598 (UTRSNOT01). A fragment comprising nucleotides 900-949 of the present sequence can be used for nucleotides 900-949 of the present sequence can be used for hybridisation. This sequence encompasses an active site residue. Northern analysis shows expression of HUPM-6 in gastrointesinal, and male an female reproductive CDNA libraries. Approximately 65% of these libraries are associated with neoplastic disorders, and proteases, i.e. HUPM-1 to -12 (see AAX06432-43), and the polymetoetides encoding them (see AAX06432-43), and the polymetoetides encoding them (see AAX06432-43). Also provided are vectors, host cells and antagonists of HUPM. Methods for treating or minn, and preventing cell proliferative disorders and immune disorders using
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ó

The

receptor or secreted PRO polypeptides given in AAY99340 to AAY99462. The transmembrane and receptor PRO proteins can be used for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions. The polypeptides and nucleotide sequences encoding then have various industrial applications, including uses as pharmaceutical and diagnostic agents. AAA37145 to AAA37330 represent PCR primers and hybridisation probes used in the isolation of the PRO polypeptides from the present invention.

secreted PRO polypeptides, useful for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions

Claim 2; Fig 155; 773pp; English.

                                              The present sequence is the coding sequence for a human PRO polypeptide (secreted and transmembrane). The PRO protein, and PRO agonists, PRO antagonists or anti-PRO antibodies are useful for preparation of a medicament useful in the treatment of a condition which is responsive to the PRO protein, agonists, antagonists or anti-PRO antibodies. The PRO protein may also be employed as molecular weight markers for protein electrophoresis. The PRO coding sequence has applications in molecular biology, including use as hybridisation probes, and in chromosome and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      useful as hybridization probes, in chromosome and gene mapping and gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Fong S;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cancer by measuring levels of cancer specific genes (CSG) in cells, tissues or body fluids. Their remission and progression, decreases and increases in CSG levels, is also monitored, by periodic sample analysis. The methods are useful for detecting cancers, especially gynecologic cancers which include ovarian, breast, endometrial and uterine cancer and lung cancer. Antibodies against the CSGs labeled with paramagnetic lons or a radioisotope is useful for imaging cancer and when conjugated with a cytotoxic agent are useful for treating cancer. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Diagnosing, staging, monitoring, imaging and treating cancer especially gynecological cancers e.g. breast, ovarian cancer and lung cancer, involves measuring cancer specific gene levels in cells and body fluids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CSG; cancer specific gene; cancer; gynecologic cancer; ovarian; breast; endometrial; uterine; lung; cytotoxic; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to detecting, diagnosing metastasis and staging
anti-sense RNA and DNA. They may also be used used to generate either transgenic animals or knockout animals which are in turn useful for development and screening of therapeutically useful reagents. The nucleic acids may also be used in gene therapy.
                                                                                                                                                                         Gaps

G-protein coupled receptors are also known as 7-transmembrane (7TM) receptors. The present sequence is located on chromosome 11g13. The AXOR14 protein functions in hormone signal transduction. AXOR14 protein may be used in the identification of agonists, antagonists or inhibitors that can be used in therapy of microbial infections (e.g. HIV-1 and HIV-2), pain, cancers, psychotic and neurological disorders, allergies, diabetes, obesity, ancrexia, bullmia, Parkinson's disease, acute heart failure, hypotension, hypertension, urinary retention, osteoporosis, angina pectoris, myocardial infarction, stroke, benign prostatic hypertrophy, vomiting, dyskinesias or Huntington's disease which may be caused by inappropriate AXOR14 activity or imbalance. The actual gene may also be used in gene therapy for the above disorders.
                                                                                                                                                                                                                                 Human; G-protein coupled receptor; AXOR14; signal transduction; 7TM receptor; gene therapy; infection; cancer; autoimmunity; Parkinson's disease; carddovascular disoxder; neurological disorder; Huntington's disease; diabetes; obesity; dyskinesias; chromosome 11q13; anorexia; bulimia; osteoporosis; 7 transmembrane receptor; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New AXOR14 polypeptides and polynucleotides useful for treating e.g. microbial infections, pain, cancers, psychotic and neurological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Score 18; DB 21; Length 2100;

This invention describes a novel human N-formyl receptor gene (I),

Including its 5' and 3' untranslated regions. The invention also

describes (a) transcription factors, RNA polymerases, pharmaceuticals

and chemicals that up- or down-regulate expression of (I); (b) mRNA (II),

and its splice variants or isoforms, transcribed from (I); (c) cDNA

cand its splice variants or isoforms, transcribed from (I); (c) cDNA

carived from (II) or from genes without introns; (d) protein (III)

derived from (II) or more epitopes of (III) or the entire protein; (f)

directed against one or more epitopes of (III) or the entire protein; (f)

systems (including eukaryotic cells, yeast cells, Kanopus Oocytes,

Baculovius systems, and bacterial expression systems) that express

cather contain it; (h) transgenic and knockout animals that express the

chalcontain it; (h) transgenic and knockout animals that express the

creceptor at altered level or not at all; (l) gene therapy method that

creceptor at altered level or not at all; (l) gene therapy method that

clusional contention or not at all; (l) gene therapy method that

collgonucleotides derived from (I); (k) diagnosis and treatment of

development of new (or evaluation of known) pharmaceuticals, compounds,

chemicals, and techniques; and (m) modified versions of the protein,

constants and exchaigues; and (m) modified versions of the protein,

constants and cechniques; and (m) modified versions of the protein,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             gene, CDNA, and mRNA sequences. (I), also related nucleic acids, proteins, antibodies, ligands etc., are potentially useful for diagnosis and (gene) therapy of diseases, also for drug screening, identification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New human N-formyl receptor gene, useful for diagnosis and treatment of

region 3 (8H3) domain containing proteins that can be used in the method of the invention. SH3 domain containing proteins that can be used in the method of the invention. SH3 domain containing proteins play a role in signalling and structural elements of cells. The method of the invention is for identifying polypeptides containing functional domains of interest (especially SH3 domains). The method comprises contacting a multivalent recognition unit (RU) complex with a number of peptides and identifying polypeptides having a selective binding affinity for the RU complex. The method is based on functional similarities and does not rely on sequence similarities. Prior methods only gave limited success for identifying proteins which contain an SH3 domain due to the minimal sequence homology among known SH3 proteins. It has been found that small peptide RUs in multivalent form have reduced specificity for a given thunctional domain compared to soreening for polypeptides containing functional domain compared to soreening for polypeptides containing functional domain that are similar to, but not identical in sequence to, the confinal target functional domain. The new method enables proteins having a common function to be identified. Identification of novel SH3 proteins will be useful for a better understanding of cell growth, malignancy, signal transduction processes, etc. New candidate drugs can be considered to the secular specificities (e.g., pharmacological activities) can
                                                                                                                                                                                                              Src-homology region 3 domain; human; mouse; SH3 domain; cell growth; cellular signalling element; cellular structural element; malignancy; protein identification; functional domain; protein screening; cellular signal transduction process; ss.

AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as cytostatic; hepatotropic; vulnerary; antipsorlatic; antiportatic; neuroprotective; costeopathic; anticonvulsant; antiarthritic; immunosuppressant; immunostimulant; cardiant; thrombolytic; coaquiant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antidiabetic; hypotensive; dermatological; immunosuppressive; antithiranmatory; antibacterial; antiviral; antifungal; antirheumatic; antithiranmatory; antibacterial; on to research or determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis,

Such fragments are used in the method of the invention which describes the isolation of a novel human TANGO-77 encoding nucleic acid and protein. Tango-77 is a member of the cytokine superfamily that is expected to inhibit inflammation by binding to the interleukin-1 receptor (IL-IR). It processes associated with acute or chronic inflammation, e.g. asthma, chronic myelogenous leukaemia, rheumatoid arthritis, psoriasis and inflammatory bowel disease. It may also induce or suppress interleukins, cytokines and growth factors. Modulators of this protein are used to treat or prevent conditions associated with abnormal levels of inflammation, or activity of IL-1 or its receptor complex.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Tango-77; human; IL-1ra; cytokine superfamily; inflammation; inhibition; interleukin-1 receptor; IL-1R; regulation; asthma; rheumatoid arthritis; chronic myelogenous leukaemla; psoriasis; inflammatory bowel disease; growth factors; treatment; IL-1 receptor complex; BAC; ss.

                                                                                                                     AAA00012
                                                                                                                                                                GST is a type 2 membrane protein useful for inhibiting a binding event between a selectin and a selectin ligand, which comprises contacting the selectin with a non-sulphated selectin ligand, GST and a small molecular agent that inhibits the sulphated activity of GST. GST is also useful in inhibiting a selectin mediated binding event. GST is useful in gene therapy to treat disorders such as acute or chronic inflammation, systemic lupus erythematosus (SLE), rheumatoid arthritis, polyarteritis nodosa, polymyositis, dermatomyositis, systemic sclerosis, diabetes, glomerulonephritis, myasthenia gravis, Sjogren's syndrome, Hashimoto's disease, direnalitis, hypoparathyroidism, pernicious anaemia, demyelinating disease, cirrhosis, ulcerative colltis, certain amountule, amocarditis, regional enteritis, adult respiratory distress syndrome, infantile eczema, psoriasis lichen planus, allergic rhinitis, bronchial asthma, hypersensitivity, rheumatic fever and tissue rejection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is human glycosyl sulfotransferase-4 (GST-4) genomic DNA encoding GST-4alpha and GST-4beta. GST-4 gene is found on chromosome 16q23.1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            glycosyl sulfotransferases (GST)-4alpha, GST-4beta and GST-6 for

Inheries constructed from human colon cancer cell lines. The present invention also describes a method of detecting differentially expressed genes correlated with a cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample derived from a cell suspected of being cancerous, where detection of the differentially expressed gene product is correlated with a cancerous state of the cell from which the test sample was derived. The polynucleotides sequences can be used in a method for detecting differentially expressed genes correlated with a cancerous state of a mammalian cell. The polynucleotides can also be used as probes for detecting and mapping related genes. They can be used in diagnosis and promosis of diseases and disorders (e.g. identification of prognosis of diseases and disorders (e.g. identification of cresponsiveness of cancer to therapy). This is particularly for breast cancer, oestrogen receptor positive breast cancer, oestrogen receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Labat I;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Polynucleotide library used to determine cancerous states of mammalian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sudduth-Klinger J;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               human signal peptide-containing proteins HSPP-1 to HSPP-134. HSPPs have human signal peptide-containing proteins HSPP-1 to HSPP-134. HSPPs have anti-acancer, anti-inflammatory, antimacrobial, nootropic, hepatotropic, neuroprotective, cardiovascular and antiasthmatic activities, and can be used in gene therapy. HSPPs can be used to treat or prevent disorders associated with decreased activity or function of HSPP. Antagonists of HSPP are used to treat or prevent disorders associated with increased activity or function of HSPP. Antagonists of activity or function of HSPP. Such diseases include cell proliferation (including cancer), inflammation, cardiovascular, neurological, captume or developmental disorders, (e.g. arteriosclerosis, cirrhosis, psoriasis, acquired immune deficiency syndrome, anamia, asthma, Crohn's disease, microbial or other infections, congestive or ischama, cardiovaterior, so arkhma, crohn's disease, Alzheimer's, Parkinson's or Huntington's diseases, schlzophrenia, ovulatory defects, muscular dystrophy). HSPP nucleic acids can be used for the recombinant production of HSPP, for detecting HSPP in standard hybridisation and amplification assays (for diagnosis and monitoring), in gene therapy, as antisense,

     sequences
to used to
triplex-forming or ribozyme therapeutics, for detecting related sequence or genetic variations, and for chromosomal mapping. HSPP are also used traise specific antibodies (Ab) and to screen for agonists and antagonists (potential therapeutic agents). Ab are used to diagnose, or monitor, HSPP-related diseases (in usual immunoassays), as therapeutic antagonists, in competitive drug screens, and for purification of HSPP from natural sources.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          An isolated polypeptide useful for the treatment and diagnosis of tumors e.g. breast cancer comprises at least an immunogenic portion of a breast tumor protein -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides the coding sequences and some protein sequences of proteins associated with breast cancer in humans. These sequences can be used in the diagnosis and treatment of cancers,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The PITSLRE protein kinase gene can be translated to give two isoforms, p110 and p58. Transcription of p58 mRNA was found to start at an internal ribosome entry site (IRES). The IRES element was found to be cell cycle regulated, p58 is produced during the G2/M stage of the cell cycle. The present sequence contains the PITSLRE protein kinase IRES and upstream nucleotides. The IRES sequence and fragments of it may be used to induce cell cycle dependent initiation of translation in eukaryotic cells. Vectors containing the IRES may be used for the preparation of compositions for the treatment of and/or prevention of a disease by gene therapy. Such diseases may be cancer and restenosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cancer associated antigen; diagnosis; research; treatment; human; breast cancer; colon cancer; gastric cancer; renal cancer; lung cancer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The PITSLRE protein kinase gene can be translated to give two isoforms, pill and p58. Transcription of p58 mRNA was found to start at an internal ribosome entry site (IRES). The IRES element was found to be cell cycle regulated, p58 is produced during the G2/M stage of the cell cycle. The present sequence contains a 5' fragment of the PITSLRE protein Kinase IRES and nucleotides upstream of the IRES. The IRES sequence and fragments of it may be used to induce cell cycle dependent initiation of translation in eukaryotic cells. Vectors containing the IRES may be used for the preparation of compositions for the treatment of and/or prevention of a disease by gene therapy. Such diseases may be cancer and restenosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

This invention describes a method where autocatalytically cleavable, zymogenic precursors of a protease (in this invention trypsinogen), have their natural cleavage site replaced by a non-natural, autocatalytically cleavable site. Such proteases are reagents for producing peptide hormones and other therapeutic proteins by cleavage of their fusion proteins, and some also have therapeutic activity themselves, e.g. thrombin for treatment of coaquiation disorders. The proteases are produced simply and in high yield without the need to add another protease for cleavage, reducing costs and avoiding contamination of the final enzyme.
                                                                                                                                                                                                                                                                                                                                                                                          1.6%; Score 17; DB 20; Length 701;

                                                                                                                                                                                                                                                                                                                The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a nucleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions or baracterised by the expression of various cancer associated antigens. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      TRXI; trypsinogen; autocatalysis; cleavage; zymogenic precursor;

This invention describes a novel chimeric serine protease compound which has antithrombotic activity and comprises two domains with a beta-sheet structure. The first domain corresponds to the first domain of a first serine protease and the second domain corresponds to the second domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Chimeric serine protease comprising Factor X and Trypsin catalytic domains, useful for identifying thrombolytic agents

ö
of a second serine protease. The products of the invention can be used for identifying antithrombotic agents by determining whether an agent modulates the activity of the serine protease. They can also be used to identify agents through rational drug design using information based on its 3-D crystal structure. The chimeric serine protease, is very good for crystallization and for determining structural data and is also useful for the identification of specific antithrombotic agents that unlike prior art agents are extremely specific for only one factor in a haematopoietic cascade.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Expression vectors E.coli LE 392 and YA 21 are preferable for mass production, and animal cells or B.subtilis are suitable for the production of an enzyme of similar activity to that of natural human spleen trypsinged. Culturing the recombinant cells produced the desired trypsin as insoluble protein in inclusion bodies and the trypsin can be isolated by lysing the cells by a suitable method. The product is used in the treatment of lesions or trauma, eg burns, gangrene, abscesses, injury etc.
                                                                                                                                                                                                                                                  Gaps
